User/Server Site Protocol  
Network HOST Questionnaire  
(Reference RFC #106, NIC Note 5776)

Attached is a summary of the responses to the referenced questionnaire.

The questions involving terminal support were of interest to members of the User/Service Site Protocol Committee in its considerations of TELNET.

The summary points out some of the key differences between line-at-a-time and character-at-a-time (or both) in handling terminal support, especially with respect to control characters. The information may prove useful as background information to TELNET implementers.

If errors of interpretation of any sites' answer have occurred, please advise me at the following address so that I may update the chart.

① PDP 10's are considered to be both character or a time and line or a time since the hardware sends a sync trap for each character input, but when the user's device is taken to be the process in control of that line. Some prior systems line or a time, others character. PPS hardware some, but most feed the operator just a PPS character.

② In the DEC 1050 OPERATING system, LF along with a number of other characters (ESC, ALT, etc) will cause a buffered line to be de-queued.

③ Punched paper tape support is generally available on the 10. The terminal user's usually not used. If input buffer fills up system will terminate reading of a record if following only as it will fail to bind input.

④ On PDP 10's control B will flip user into other mode for handling.

⑤ TENEX providing a way of setting control, supports all machine specific TRAC log.
